

① Time Complexity (T.C) :- It refers to the amount of time an algorithm takes to run as a function of input size ( $n$ ).

1. Best Case

2. Average Case

3. Worst Case  $\Rightarrow$  It is represented using  $\Theta$  notation.

eg:-  $\{ \frac{20}{\cancel{1}}, \underline{\frac{50}{1}}, \underline{\frac{30}{1}}, \underline{\frac{6}{1}}, \frac{4}{\cancel{1}} \}$  search = 100  
 $\Theta(\underline{n})$

- ① In worst case scenario, it had to explore all the elements and still the element was not found.  
So let's say that if the size of the set is  $n$ , then all  $n$  elements had to be checked whether it's equal to 100 or not.

④ Time Taken :-

Best  
case

Avg  
case

Worst  
case

$$\Theta\left(\frac{n+1}{2}\right) = \Theta\left(\frac{\cancel{n}}{2} + \frac{1}{2}\right)$$

$$= \Theta\left(\frac{n}{2} + c\right) \text{ where } c = \frac{1}{2}$$

$$\frac{n}{2} = n \cdot \frac{1}{2}$$

$$= c \cdot \Theta\left(\frac{n}{2}\right) = \frac{c}{2} \cdot \Theta(n)$$

①  
arr = [ 10 | 72 | 89 | 76 | 90 | 5 ]  
n = 6  
target = 160

→ for (int i= 0; i < n; i++)

{  
    if ( arr[i] == target )  
        return i; }  
 $O(1) = \text{constant}$

y/n for loop

T.C =  $O(n)$

0

10	20	30	40
----	----	----	----

$$\text{Ans} = 10 + 20 + 30$$

```

int sum=0;
for (int i=0; i < 4; i++)
{
    → sum = sum + arr[i];
}
return sum;
    + 40 = 100

```

$\Theta(1) = \text{constant}$

⑥

```
int c = 0;
```

```
c++;
```

```
int sum = sum + 10;
```

```
return sum;
```

$T.C = \Theta(1)$

## ① Nested Loop :-

```
for (int i=0; i<=m; i++)
```

```
{   for (int j=0; j<n; j++)
```

{

// Some statements

$$T.C = \Theta(m * n)$$

$$\underline{\Theta(K)}$$

{

i=0, j= n times

i=1, j= n times

i=m, j= n times

}

①  $\Theta(m * n) = \Theta(500 * n)$

$m = 10^{10}$     $n = 10^{10}$

$= 500 \Theta(n)$

①  $\Theta(10^{20})$

$\Theta(c \cdot n) = c \cdot \Theta(n)$

constant

$$\Theta(n+n) = \Theta(2 \cdot n)$$
$$= 2 \cdot \Theta(n) = \Theta(n)$$

✓

VIMP

$$\Theta(m+n) = \Theta(\max(m, n))$$

①  $\text{for } (\text{int } i=0; i < \underline{m}; i++)$

{

$\text{in some statement}$

}

$\text{for } (\text{int } i=0; i < n; i++)$

{  $\text{in some statement}$

}

$\text{if } (m > n)$

$\Rightarrow O(m)$

$\text{if } (n > m) \Rightarrow \underline{O(n)}$

①

```
int count = 0;
for (int i = 0; i < m; i++)
{
    for (int j = 0; j < n; j++)
    {
        for (int k = 0; k < q; k++)
        {
            count = count + 10;
        }
    }
}
T.C = Θ(m * n * q)
```

① Space Complexity :- It refers to the amount of <sup>extra</sup> memory or storage space required by an algorithm to complete its execution.

① e.g:- void func ( int <sup>aux. array</sup> arr1[m] ,  
        <sup>4</sup> int arr2[n] )  
    {  
        int arr(<sup>Input array</sup> k) ;  
        for (int i = 0 ; i <= k ; i++)  
        {  
            count = count + 100 ;  
        }  
    }  
    S.C =  $\Theta(m+n)$

① void func2( int arr1[n], int arr2[m] )  
{  
    int vis1[n][m];  
    int vis2[r][q];  
}

② S.C =  $\Theta(nm + rq)$   
 $= \Theta(\max(nm, rq))$

0	1	2	3
0	10   20   30   40		
1	50   60   70   80		
2	5   8   2   13		

$3 \times 4$        $O(m \times n)$
