

① Approach to solve any Low Level Design in an Interview

1. Understand the problem first and from the problem, you need to extract keyword or important player from it.

2. Ask your interviewer clarifying question based on the problem that is asked to you.

3. Design Approach (Use Bottom Up Approach)

(i) Identify and design smaller component first.

(ii) Use this small component to design bigger component.

(iii) Repeat above 2 steps until the complete system is built.

4. Requirement collection.

5. Define different elements of your system :- (i) System (ii) Actor

6. Define Use Cases for the system
and those use cases would be according to their respective interaction with a particular actor.
7. Describe Relationship betⁿ and among actors and their use cases.

8. Identify & design classes of smaller component (like point 3)
9. Discuss Design Pattern with your interviewer.
10. Provide SKelton code of the classes that you designed in step 8.

Class Name

① Data member (property of that class)

② Member function (function which that class does in system).

①

Abstract class / Interface
function
